

Install agent skills you can *trust*.

INSTALL (NODE.JS 22+)

One command installs a skill into Claude Code, Codex, Cursor and VS Code. agenthub scans it first, checks it against what it declares, and records every byte, so you can verify, update and roll back.

`npm install -g @ekupekua/agenthub`

then type **agenthub** in any terminal

01 WHAT IT IS

All coding tools learn **skills**: folders with a `SKILL.md` plus optional scripts (the open Agent Skills format). agenthub is the package manager and trust layer for them: one place to find, check, install, update and undo skills across all your agents.

Claude Code reads `.claude/skills`
Codex reads `.agents/skills`
Cursor, VS Code read both

agenthub writes the smallest set of folders that covers every agent you use.

02 FIRST FIVE MINUTES

```
# 1. check your machine and agents
agenthub doctor
# 2. find a skill
agenthub search testing
agenthub info web-testing
# 3. install it (run inside your
project)
agenthub install web-testing
# 4. confirm nothing changed
agenthub verify
```

Every install shows a **plan** first: folders, agents, findings and requirements. Nothing is written until you confirm.

03 INTERACTIVE MODE

Run agenthub with no arguments for the full-screen app: animated plans, trust receipts and live progress.

```
/                    open the command
                     palette
/search /install    find and install with
                     arrow keys
/update /diff        see what an update
                     newly wants
/agents /doctor     choose agents, run
                     health checks

[Esc] back · [?] help · [q] quit ·
AGENTHUB_REDUCED_MOTION=1 calms animation
```

04 EVERYDAY COMMANDS

```
install <skill>    install from the
                     registry (name@^1.2
                     works)
install ./folder    install a local skill or
                     .skillpkg
install             restore everything in
                     the lockfile
list                installed skills, agents,
                     approval
verify              re-hash files, report
                     edits (exit 4)
update --check      available updates,
                     changes nothing
update --safe       apply only updates
                     that add nothing new
diff <skill>        what the next version
                     can do extra
approve <skill>     record approval of its
                     capabilities
rollback <skill>    restore the previous
                     version
remove <skill>       remove only files
                     agenthub installed
pack ./folder       build a reproducible
                     .skillpkg
```

Flags: `--dry-run` plan only · `--yes` no prompt
· `-g` all projects · `--agent` `claude-code,cursor`
· `--json` for scripts & CI

05 HOW SAFETY WORKS

Before anything is written, a static scanner checks every file and compares what it finds with what the skill declares in `agenthub.yaml`.

INFO behavior the skill declared, shown to you

WARN undeclared network, programs or env reads: you must confirm

BLOCK secret reads, download-and-run, obfuscation, hidden instructions, persistence: install stops

agenthub never runs a skill's scripts. Installs are all-or-nothing, and a failed update restores the old version.

06 UPDATES YOU APPROVE

Each version gets a **capability inventory**: programs it runs, hosts it contacts, env vars and secrets it reads, external links it follows. If an update can do more than the version you approved, agenthub stops:

```
+ network telemetry.example.com
+ exec     uvx
This update can do more than the
version you approved. Approve? [y/N]
```

`--yes` alone never approves new capabilities; use `--approve-capabilities` after agenthub diff.

07 TEAMS & PROJECTS

Inside a git project, skills install into that project and are recorded in `.agenthub/agenthub.lock` (versions + per-file hashes). **Commit the lockfile and the skill folders**: teammates get identical skills on clone, and agenthub verify catches tampering.

08 PUBLISH YOUR OWN SKILL

```
# agenthub.yaml next to SKILL.md
schema: 1
version: 1.0.0
permissions:
  network: [registry.npmjs.org]
  exec: [npm, node]
```

Check with `agenthub install ./my-skill --dry-run`, then `agenthub pack ./my-skill` and upload it on the website's **Publish** page. Versions are immutable; every upload is scanned.

09 IF SOMETHING'S OFF

```
skill not shown    Claude Code /reload-
                     skills; restart Cursor
exit 3             blocked or needs
                     approval: read the plan
exit 4             files changed: install
                     <skill> --force
exit 5             missing runtime, e.g.
                     node >=22
```
